

# How to enable/disable cookies on Droid or Android phones

Every once in a while, you will need to enable cookies on your Droid or Android phone. By default, Android phones will accept browser cookies from web sites. But sometimes this option is turned off and many web sites will not function correctly. If you are browsing a web site and it says you need to enable cookies, here are the steps you need to take to turn on cookies.

## Step 1

If your web browser is not already running, you need to start it by selecting the Browser application on your phone.

## Step 2

Once the web browser is started, push the “Menu” button on your phone. Three horizontal lines at bottom left of screen. Select on the “Settings” option.

## Step 3

The “Settings” functions is where you will find most of the options to control the Android web browser. Scroll down until you find the “Accept cookies” option. The box next to it should not be checked. Selecting on the box will put a green check mark and enable cookies for the web browser. If you want to disable cookies, just toggle off the check box.
